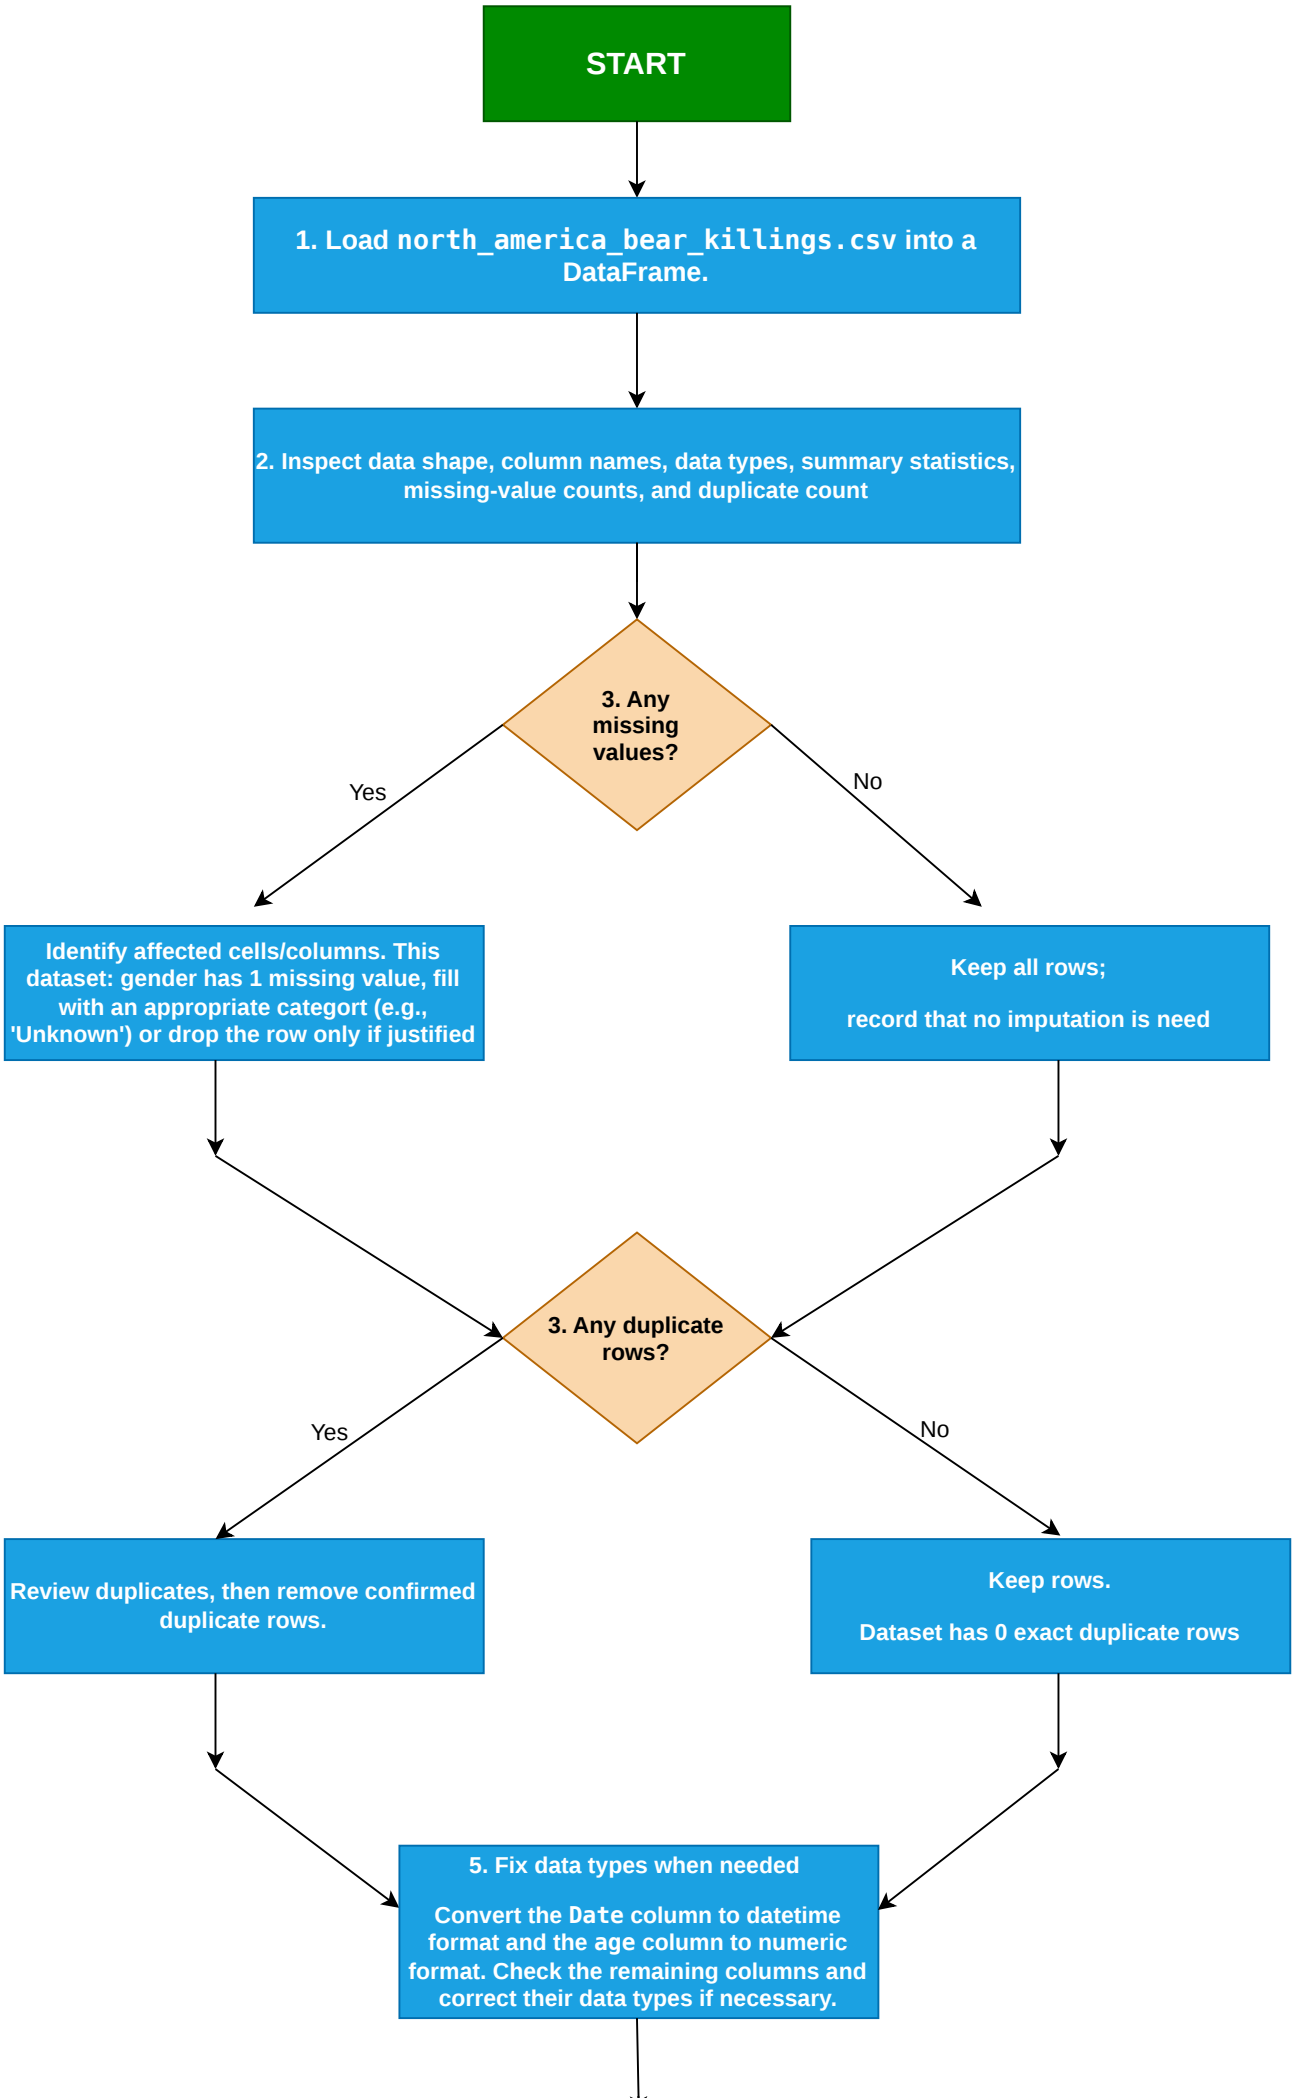
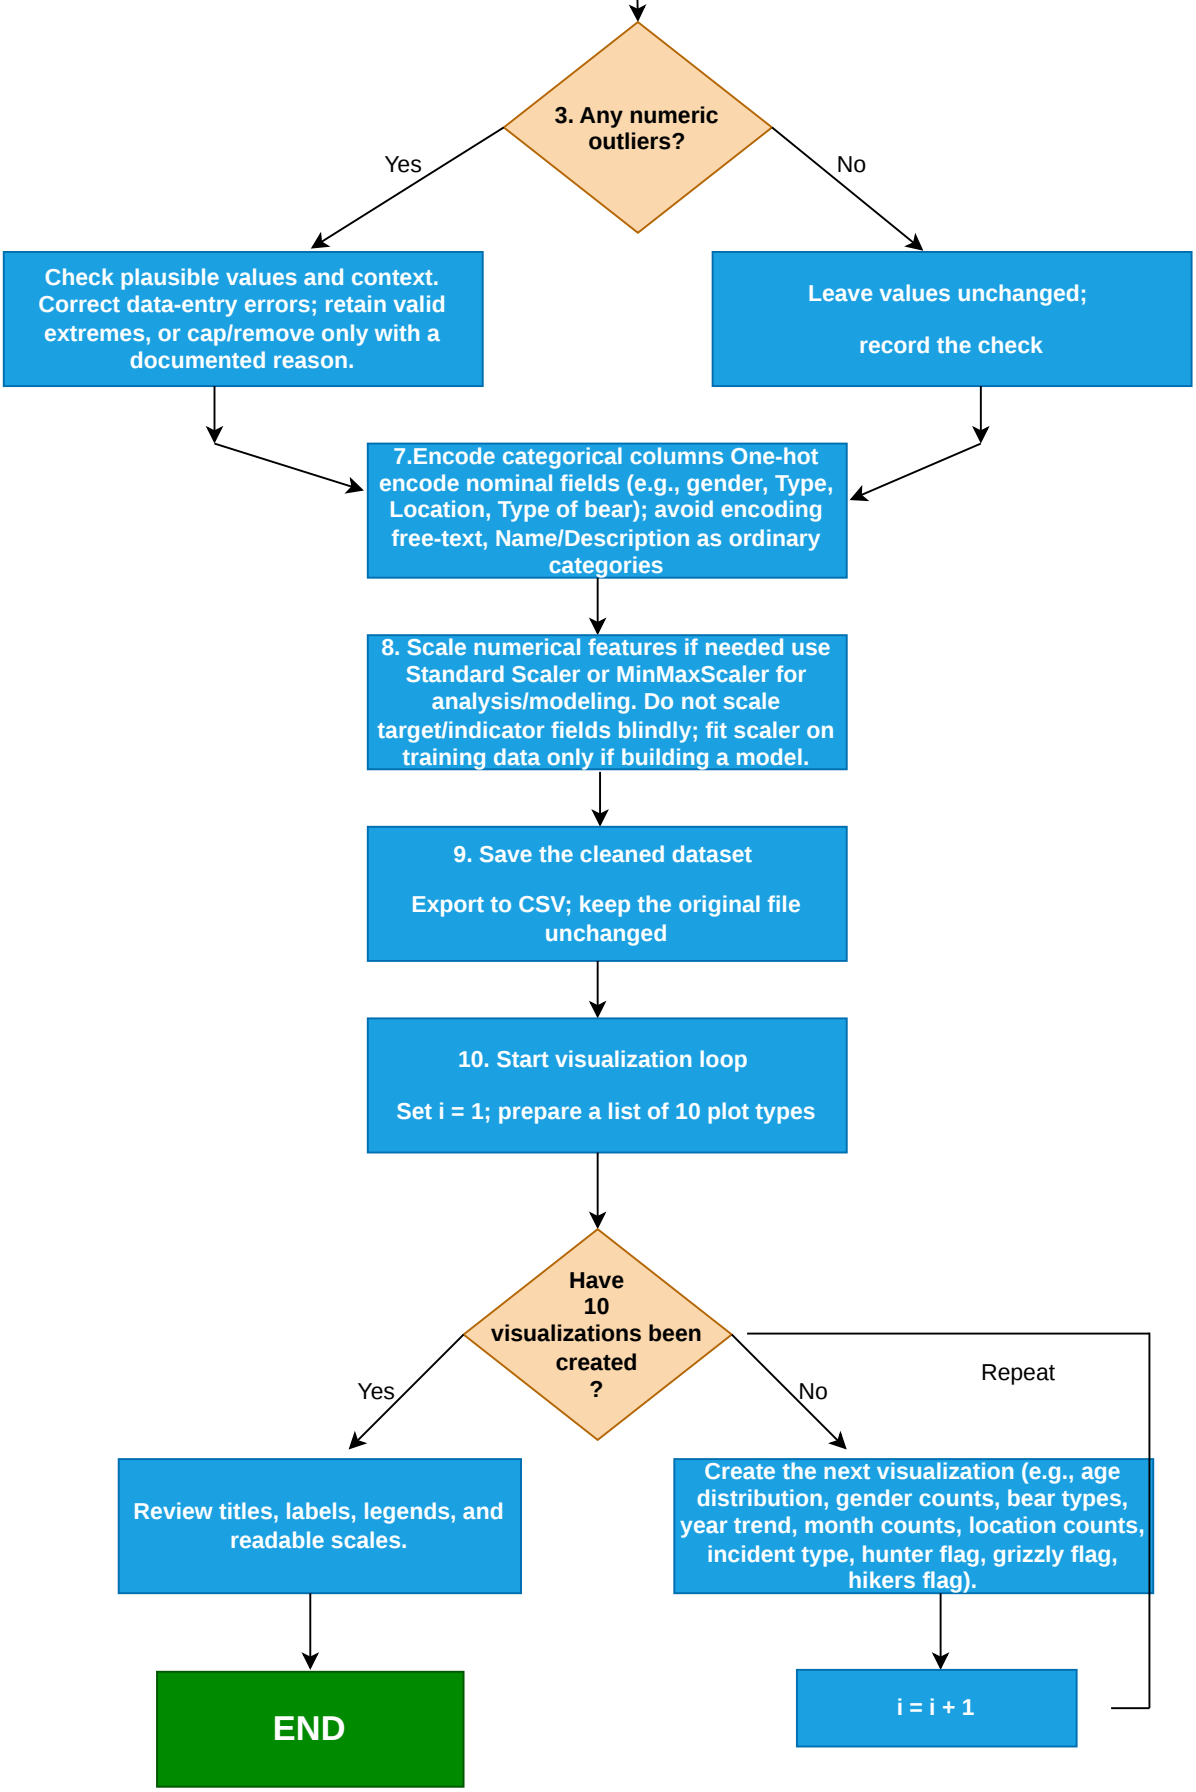
DATA CLEANING & VISUALIZATION FLOWCHART





3. Any numeric outliers?
Yes
No
Check plausible values and context. Correct data-entry errors; retain valid extremes, or cap/remove only with a documented reason.
Leave values unchanged;
record the check
7.Encode categorical columns One-hot encode nominal fields (e.g., gender, Type, Location, Type of bear); avoid encoding free-text, Name/Description as ordinary categories
8. Scale numerical features if needed use Standard Scaler or MinMaxScaler for analysis/modeling. Do not scale target/indicator fields blindly; fit scaler on training data only if building a model.
9. Save the cleaned dataset
Export to CSV; keep the original file unchanged
10. Start visualization loop
Set i = 1; prepare a list of 10 plot types
Have 10 visualizations been created ?
Yes
No
Repeat
Review titles, labels, legends, and readable scales.
Create the next visualization (e.g., age distribution, gender counts, bear types, year trend, month counts, location counts, incident type, hunter flag, grizzly flag, hikers flag).
END
i = i + 1
